

Securing the remote workforce

Strong authentication protects employees working remotely

In today's enterprise journey to digital transformation, remote work is on the rise. Advancements in technology make it possible for employees to work from anywhere, but also introduce a new set of challenges for IT departments. Unsecured WiFi networks, unmanaged personal mobile devices, and phishing scams make it easy to steal user credentials and difficult to securely manage geographically dispersed teams.

While the concept of remote work is not new, recent global events are driving these numbers even higher. Based on a survey¹ performed by CSO Online in March 2020, high tech and retail, wholesale, and distribution organizations are impacted the most.

Enabling two-factor (2FA) or multi-factor authentication (MFA) across all business applications, platforms, and systems is a proven security best practice for organizations with work from home policies.

With YubiKey and Axiad Cloud, your organization can easily deploy and manage a multi-factor authentication solution to secure your digital interactions. Our joint solution provides fast, secure, and scalable deployment through Axiad Cloud, enabling an environment where users can be engaged and empowered.

IAM systems & IdPs

IAM systems and IdPs enable employees to access business-critical apps and services, and need to be secure.

Computer & VDI Login

If remote employee computers are not secured properly, they can provide entry points for external threats.

Virtual Private Networks

Using VPNs to access corporate networks across home and public wifi can be risky when relying solely on passwords.

Password Managers

Employees need a simple and safe way to create, store, manage, and share passwords across teams.

About Axiad Axiad delivers an agile, user-centric identity platform that helps leaders manage cybersecurity risks, compliance, and operational efficiency for their workforce, partners, and customers.
